One More Time: *How Do You Motivate Employees?*

by Frederick Herzberg

THE IDEA IN BRIEF

THE surest way to get someone to do something is with a kick in the ass, or KITA. In the workplace, KITAs can be positive or negative. But even the positive ones—raises, bonuses, recognition, extra time off—produce only movement, not motivation. Any performance improvement that results is temporary. A worker who gets a raise, for example, is motivated just to get another raise. The initial KITA must be followed by other KITAs, or else the positive effects will soon wear off.

KITAs can also come from company policy, supervision, interpersonal relationships, working conditions, salary, status, and security. But these all represent *hygiene factors*—techniques for avoiding dissatisfaction that constitute little more than ways to maintain job performance at minimally acceptable levels. Moreover, they’re extrinsic to the work itself. The only way to inspire genuine, and therefore self-perpetuating, motivation is through techniques focused on job content.

THE IDEA AT WORK

INTRINSIC motivation arises from a unique human characteristic—the desire to achieve, and, through achievement, to experience psychological growth. Techniques focused on job content respond to this need for achievement and fulfillment by creating work that offers challenge, responsibility, and the potential for growth. The benefits are long lasting because

- job responsibilities are more nearly commensurate with skills of the people hired to fill them
- workers who have still more ability will be better able to demonstrate it and win promotion.

The following job-enrichment process relies on unleashing employees’ intrinsic motivation rather than jump-starting behavior through an unending sequence of KITAs:

- 1. Select jobs for which enrichment is possible, practical, and will make a difference.** Not all jobs can be enriched, nor do all jobs need to be enriched.
- 2. Approach these jobs with the conviction that they can be changed.**
- 3. Brainstorm a list of changes that may enrich the jobs.** For example, give employees specific assignments that allow them to become experts, or give them additional authority to accomplish the tasks already assigned to them.

- 4. Screen the list to eliminate suggestions that involve hygiene, rather than intrinsic motivation.**
- 5. Eliminate generalities, such as “give him more responsibility.”**
- 6. Avoid horizontal loading suggestions,** such as adding another task or rotating job assignments. Horizontal loading merely enlarges the meaninglessness of a job.
- 7. Don’t allow participation by the employees whose jobs are to be enriched.** Their direct involvement contaminates the process.
- 8. In the initial attempts at job enrichment, set up a controlled experiment.** Use at least two equivalent groups—one whose jobs are enriched, the other not.
- 9. Be prepared for a temporary drop in performance in the enriched group.** During the first few weeks, participants will be adjusting to their new roles.
- 10. Expect early anxiety and hostility from frontline supervisors, stemming from fear of poor performance.** Once the process produces some success, most supervisors will happily adapt to being freed from having to spend all their time checking the work of subordinates.

One More Time: How Do You Motivate Employees?

by Frederick Herzberg

How many articles, books, speeches, and workshops have pleaded plaintively, "How do I get an employee to do what I want?"

The psychology of motivation is tremendously complex, and what has been unraveled with any degree of assurance is small indeed. But the dismal ratio of knowledge to speculation has not dampened the enthusiasm for new forms of snake oil that are constantly coming on the market, many of them with academic testimonials. Doubtless this article will have no depressing impact on the market for snake oil, but since the ideas expressed in it have been tested in many corporations and other organizations, it will help – I hope – to redress the imbalance in the aforementioned ratio.

'Motivating' with KITA

In lectures to industry on the problem, I have found that the audiences are anxious for quick and practical answers, so I will begin with a straightforward, practical formula for moving people.

What is the simplest, surest, and most direct way of getting someone to do something? Ask? But if the person responds that he or she does not want to do it, then that calls for psychological consultation to determine the reason for such obstinacy. Tell the person? The response shows that he or she does not understand you, and now an expert in communication methods has to be brought in to show you how to get through. Give the person a monetary incentive? I do not need to remind the reader of the com-

plexity and difficulty involved in setting up and administering an incentive system. Show the person? This means a costly training program. We need a simple way.

Every audience contains the "direct action" manager who shouts, "Kick the person!" And this type of manager is right. The surest and least circumlocuted way of getting someone to do something is to administer a kick in the pants – to give what might be called the KITA.

There are various forms of KITA, and here are some of them:

Negative physical KITA. This is a literal application of the term and was frequently used in the past. It has, however, three major drawbacks: (1) it is inelegant; (2) it contradicts the precious image of benevolence that most organizations cherish; and (3) since it is a physical attack, it directly stimulates the autonomic nervous system, and this often

*To mark the 65th birthday of the Harvard Business Review, it's appropriate to republish as a "Classic" one of its landmark articles. Frederick Herzberg's contribution has sold more than 1.2 million reprints since its publication in the January-February 1968 issue. By some 300,000 copies over the runner-up, that is the largest sale of any of the thousands of articles that have ever appeared between HBR's covers. Frederick Herzberg, Distinguished Professor of Management at the University of Utah, was head of the department of psychology at Case Western Reserve University when he wrote this article. His writings include the book *Work and the Nature of Man* (World, 1966).*

results in negative feedback – the employee may just kick you in return. These factors give rise to certain taboos against negative physical KITA.

In uncovering infinite sources of psychological vulnerabilities and the appropriate methods to play tunes on them, psychologists have come to the rescue of those who are no longer permitted to use negative physical KITA. “He took my rug away”; “I wonder what she meant by that”; “The boss is always going around me” – these symptomatic expressions of ego sores that have been rubbed raw are the result of application of:

Negative psychological KITA. This has several advantages over negative physical KITA. First, the cruelty is not visible; the bleeding is internal and comes much later. Second, since it affects the higher cortical centers of the brain with its inhibitory powers, it reduces the possibility of physical backlash. Third, since the number of psychological pains that a person can feel is almost infinite, the direction and site possibilities of the KITA are increased many times. Fourth, the person administering the kick can manage to be above it all and let the system accomplish the dirty work. Fifth, those who practice it receive some ego satisfaction (one-upmanship), whereas they would find drawing blood abhorrent. Finally, if the employee does complain, he or she can always be accused of being paranoid; there is no tangible evidence of an actual attack.

Now, what does negative KITA accomplish? If I kick you in the rear (physically or psychologically), who is motivated? *I* am motivated; *you* move! Negative KITA does not lead to motivation, but to movement. So:

Positive KITA. Let us consider motivation. If I say to you, “Do this for me or the company, and in return I will give you a reward, an incentive, more status, a promotion, all the quid pro quos that exist in the industrial organization,” am I motivating you? The overwhelming opinion I receive from management people is, “Yes, this is motivation.”

I have a year-old Schnauzer. When it was a small puppy and I wanted it to move, I kicked it in the rear and it moved. Now that I have finished its obedience training, I hold up a dog biscuit when I want the Schnauzer to move. In this instance, who is motivated – I or the dog? The dog wants the biscuit, but it is I who want it to move. Again, I am the one who is motivated, and the dog is the one who moves. In this instance all I did was apply KITA frontally; I exerted a pull instead of a push. When industry wishes to use such positive KITAs, it has available an incredible number and variety of dog biscuits (jelly beans for humans) to wave in front of employees to get them to jump.

Why is it that managerial audiences are quick to see that negative KITA is *not* motivation, while they are almost unanimous in their judgment that positive KITA *is* motivation. It is because negative KITA is rape, and positive KITA is seduction. But it is infinitely worse to be seduced than to be raped; the latter is an unfortunate occurrence, while the former signifies that you were a party to your own downfall. This is why positive KITA is so popular: it is a tradition; it is the American way. The organization does not have to kick you; you kick yourself.

Myths About Motivation

Why is KITA not motivation? If I kick my dog (from the front or the back), he will move. And when I want him to move again, what must I do? I must kick him again. Similarly, I can charge a person’s battery, and then recharge it, and recharge it again. But it is only when one has a generator of one’s own that we can talk about motivation. One then needs no outside stimulation. One *wants* to do it.

With this in mind, we can review some positive KITA personnel practices that were developed as attempts to instill “motivation”:

1. Reducing time spent at work. This represents a marvelous way of motivating people to work – getting them off the job! We have reduced (formally and informally) the time spent on the job over the last 50 or 60 years until we are finally on the way to the “6½-day weekend.” An interesting variant of this approach is the development of off-hour recreation programs. The philosophy here seems to be that those who play together, work together. The fact is that motivated people seek more hours of work, not fewer.

2. Spiraling wages. Have these motivated people? Yes, to seek the next wage increase. Some medievalists still can be heard to say that a good depression will get employees moving. They feel that if rising wages don’t or won’t do the job, reducing them will.

3. Fringe benefits. Industry has outdone the most welfare-minded of welfare states in dispensing cradle-to-the-grave succor. One company I know of had an informal “fringe benefit of the month club” going for a while. The cost of fringe benefits in this country has reached approximately 25% of the wage dollar, and we still cry for motivation.

People spend less time working for more money and more security than ever before, and the trend cannot be reversed. These benefits are no longer rewards; they are rights. A 6-day week is inhuman, a 10-hour day is exploitation, extended medical coverage is a basic decency, and stock options are the

salvation of American initiative. Unless the ante is continuously raised, the psychological reaction of employees is that the company is turning back the clock.

When industry began to realize that both the economic nerve and the lazy nerve of their employees had insatiable appetites, it started to listen to the behavioral scientists who, more out of a humanist tradition than from scientific study, criticized management for not knowing how to deal with people. The next KITA easily followed.

4. Human relations training. Over 30 years of teaching and, in many instances, of practicing psychological approaches to handling people have resulted in costly human relations programs and, in the end, the same question: How do you motivate workers? Here, too, escalations have taken place. Thirty years ago it was necessary to request, "Please don't spit on the floor." Today the same admonition requires three "pleases" before the employee feels that a superior has demonstrated the psychologically proper attitude.

The failure of human relations training to produce motivation led to the conclusion that supervisors or managers themselves were not psychologically true to themselves in their practice of interpersonal decency. So an advanced form of human relations KITA, sensitivity training, was unfolded.

5. Sensitivity training. Do you really, really understand yourself? Do you really, really, really trust other people? Do you really, really, really, really cooperate? The failure of sensitivity training is now being explained, by those who have become opportunistic exploiters of the technique, as a failure to really (five times) conduct proper sensitivity training courses.

With the realization that there are only temporary gains from comfort and economic and interpersonal KITA, personnel managers concluded that the fault lay not in what they were doing, but in the employee's failure to appreciate what they were doing. This opened up the field of communications, a whole new area of "scientifically" sanctioned KITA.

6. Communications. The professor of communications was invited to join the faculty of management training programs and help in making employees understand what management was doing for them. House organs, briefing sessions, supervisory instruction on the importance of communication, and all sorts of propaganda have proliferated until today there is even an International Council of Industrial Editors. But no motivation resulted, and the obvious thought occurred that perhaps management was not hearing what the employees were saying. That led to the next KITA.

7. Two-way communication. Management ordered morale surveys, suggestion plans, and group participation programs. Then both employees and management were communicating and listening to each other more than ever, but without much improvement in motivation.

The behavioral scientists began to take another look at their conceptions and their data, and they took human relations one step further. A glimmer of truth was beginning to show through in the writings of the so-called higher-order-need psychologists. People, so they said, want to actualize themselves. Unfortunately, the "actualizing" psychologists got mixed up with the human relations psychologists, and a new KITA emerged.

8. Job participation. Though it may not have been the theoretical intention, job participation often became a "give them the big picture" approach. For example, if a man is tightening 10,000 nuts a day on an assembly line with a torque wrench, tell him he is building a Chevrolet. Another approach had the goal of giving employees a "feeling" that they are determining, in some measure, what they do on the job. The goal was to provide a *sense* of achievement rather than a substantive achievement in the task. Real achievement, of course, requires a task that makes it possible.

But still there was no motivation. This led to the inevitable conclusion that the employees must be sick, and therefore to the next KITA.

9. Employee counseling. The initial use of this form of KITA in a systematic fashion can be credited to the Hawthorne experiment of the Western Electric Company during the early 1930s. At that time, it was found that the employees harbored irrational feelings that were interfering with the rational operation of the factory. Counseling in this instance was a means of letting the employees unburden themselves by talking to someone about their problems. Although the counseling techniques were primitive, the program was large indeed.

The counseling approach suffered as a result of experiences during World War II, when the programs themselves were found to be interfering with the operation of the organizations; the counselors had forgotten their role of benevolent listeners and were attempting to do something about the problems that they heard about. Psychological counseling, however, has managed to survive the negative impact of World War II experiences and today is beginning to flourish with renewed sophistication. But, alas, many of these programs, like all the others, do not seem to have lessened the pressure of demands to find out how to motivate workers.

Exhibit I

Factors affecting job attitudes as reported in 12 investigations

Since KITA results only in short-term movement, it is safe to predict that the cost of these programs will increase steadily and new varieties will be developed as old positive KITAs reach their satiation points.

Hygiene vs. Motivators

Let me rephrase the perennial question this way: How do you install a generator in an employee? A brief review of my motivation-hygiene theory of job

attitudes is required before theoretical and practical suggestions can be offered. The theory was first drawn from an examination of events in the lives of engineers and accountants. At least 16 other investigations, using a wide variety of populations (including some in the Communist countries), have since been completed, making the original research one of the most replicated studies in the field of job attitudes.

The findings of these studies, along with corroboration from many other investigations using differ-

ent procedures, suggest that the factors involved in producing job satisfaction (and motivation) are separate and distinct from the factors that lead to job dissatisfaction. Since separate factors need to be considered, depending on whether job satisfaction or job dissatisfaction is being examined, it follows that these two feelings are not opposites of each other. The opposite of job satisfaction is not job dissatisfaction but, rather, *no* job satisfaction; and similarly, the opposite of job dissatisfaction is not job satisfaction, but *no* job dissatisfaction.

Stating the concept presents a problem in semantics, for we normally think of satisfaction and dissatisfaction as opposites – i.e., what is not satisfying must be dissatisfying, and vice versa. But when it comes to understanding the behavior of people in their jobs, more than a play on words is involved.

Two different needs of human beings are involved here. One set of needs can be thought of as stemming from humankind's animal nature – the built-in drive to avoid pain from the environment, plus all the learned drives that become conditioned to the basic biological needs. For example, hunger, a basic biological drive, makes it necessary to earn money, and then money becomes a specific drive. The other set of needs relates to that unique human characteristic, the ability to achieve and, through achievement, to experience psychological growth. The stimuli for the growth needs are tasks that induce growth; in the industrial setting, they are the job content. *Contrariwise*, the stimuli inducing pain-avoidance behavior are found in the job environment.

The growth or *motivator* factors that are intrinsic to the job are: achievement, recognition for achievement, the work itself, responsibility, and growth or advancement. The dissatisfaction-avoidance or hygiene (KITA) factors that are extrinsic to the job include: company policy and administration, supervision, interpersonal relationships, working conditions, salary, status, and security.

A composite of the factors that are involved in causing job satisfaction and job dissatisfaction, drawn from samples of 1,685 employees, is shown in *Exhibit I*. The results indicate that motivators were the primary cause of satisfaction, and hygiene factors the primary cause of unhappiness on the job. The employees, studied in 12 different investigations, included lower level supervisors, professional women, agricultural administrators, men about to retire from management positions, hospital maintenance personnel, manufacturing supervisors, nurses, food handlers, military officers, engineers, scientists, housekeepers, teachers, technicians, female assemblers, accountants, Finnish foremen, and Hungarian engineers.

They were asked what job events had occurred in their work that had led to extreme satisfaction or extreme dissatisfaction on their part. Their responses are broken down in the exhibit into percentages of total "positive" job events and of total "negative" job events. (The figures total more than 100% on both the "hygiene" and "motivators" sides because often at least two factors can be attributed to a single event; advancement, for instance, often accompanies assumption of responsibility.)

To illustrate, a typical response involving achievement that had a negative effect for the employee was, "I was unhappy because I didn't do the job successfully." A typical response in the small number of positive job events in the company policy and administration grouping was, "I was happy because the company reorganized the section so that I didn't report any longer to the guy I didn't get along with."

As the lower right-hand part of the exhibit shows, of all the factors contributing to job satisfaction, 81% were motivators. And of all the factors contributing to the employees' dissatisfaction over their work, 69% involved hygiene elements.

Eternal triangle. There are three general philosophies of personnel management. The first is based on organizational theory, the second on industrial engineering, and the third on behavioral science.

Organizational theorists believe that human needs are either so irrational or so varied and adjustable to specific situations that the major function of personnel management is to be as pragmatic as the occasion demands. If jobs are organized in a proper manner, they reason, the result will be the most efficient job structure, and the most favorable job attitudes will follow as a matter of course.

Industrial engineers hold that humankind is mechanistically oriented and economically motivated and that human needs are best met by attuning the individual to the most efficient work process. The goal of personnel management therefore should be to concoct the most appropriate incentive system and to design the specific working conditions in a way that facilitates the most efficient use of the human machine. By structuring jobs in a manner that leads to the most efficient operation, engineers believe that they can obtain the optimal organization of work and the proper work attitudes.

Behavioral scientists focus on group sentiments, attitudes of individual employees, and the organization's social and psychological climate. This persuasion emphasizes one or more of the various hygiene and motivator needs. Its approach to personnel management is generally to emphasize some form of human relations education, in the hope of instilling healthy employee attitudes and an organiza-

tional climate that is considered to be felicitous to human values. The belief is that proper attitudes will lead to efficient job and organizational structure.

There is always a lively debate about the overall effectiveness of the approaches of organizational theorists and industrial engineers. Manifestly both have achieved much. But the nagging question for behavioral scientists has been: What is the cost in human problems that eventually cause more expense to the organization – for instance, turnover, absenteeism, errors, violation of safety rules, strikes, restriction of output, higher wages, and greater fringe benefits? On the other hand, behavioral scientists are hard put to document much manifest improvement in personnel management, using their approach.

The three philosophies can be depicted as a triangle, as is done in *Exhibit II*, with each persuasion claiming the apex angle. The motivation-hygiene theory claims the same angle as industrial engineering, but for opposite goals. Rather than rationalizing the work to increase efficiency, the theory suggests that work be *enriched* to bring about effective utilization of personnel. Such a systematic attempt to motivate employees by manipulating the motivator factors is just beginning.

The term *job enrichment* describes this embryonic movement. An older term, *job enlargement*, should be avoided because it is associated with past failures stemming from a misunderstanding of the problem. Job enrichment provides the opportunity for the employee's psychological growth, while job enlargement merely makes a job structurally bigger. Since scientific job enrichment is very new, this article only suggests the principles and practical steps that have recently emerged from several successful experiments in industry.

Job loading. In attempting to enrich certain jobs, management often reduces the personal contribution of employees rather than giving them opportunities for growth in their accustomed jobs. Such endeavors, which I shall call horizontal job loading (as opposed to vertical loading, or providing motivator factors), have been the problem of earlier job enlargement programs. Job loading merely enlarges the meaninglessness of the job. Some examples of this approach, and their effect, are:

- Challenging the employee by increasing the amount of production expected. If each tightens 10,000 bolts a day, see if each can tighten 20,000 bolts a day. The arithmetic involved shows that multiplying zero by zero still equals zero.
- Adding another meaningless task to the existing one, usually some routine clerical activity. The arithmetic here is adding zero to zero.

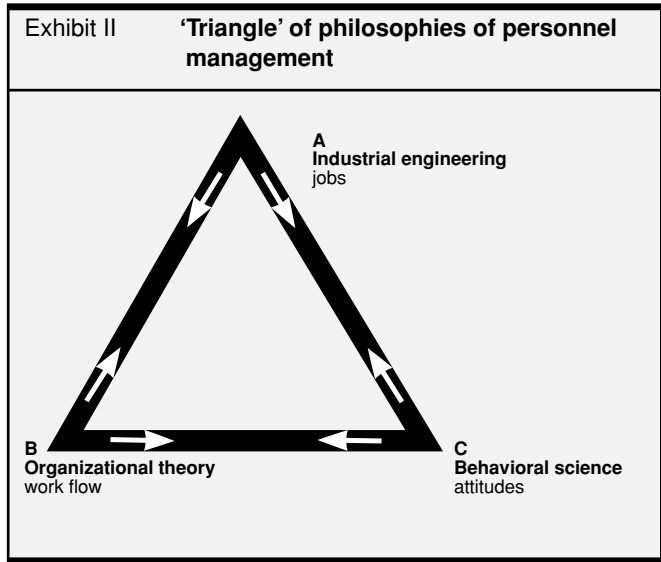

Exhibit III Principles of vertical job loading

Principle	Motivators involved
A Removing some controls while retaining accountability	Responsibility and personal achievement
B Increasing the accountability of individuals for own work	Responsibility and recognition
C Giving a person a complete natural unit of work (module, division, area, and so on)	Responsibility, achievement, and recognition
D Granting additional authority to employees in their activity; job freedom	Responsibility, achievement, and recognition
E Making periodic reports directly available to the workers themselves rather than to supervisors	Internal recognition
F Introducing new and more difficult tasks not previously handled	Growth and learning
G Assigning individuals specific or specialized tasks, enabling them to become experts	Responsibility, growth, and advancement

□ Rotating the assignments of a number of jobs that need to be enriched. This means washing dishes for a while, then washing silverware. The arithmetic is substituting one zero for another zero.

□ Removing the most difficult parts of the assignment in order to free the worker to accomplish more of the less challenging assignments. This traditional industrial engineering approach amounts to subtraction in the hope of accomplishing addition.

These are common forms of horizontal loading that frequently come up in preliminary brainstorming sessions of job enrichment. The principles of vertical loading have not all been worked out as yet, and they remain rather general, but I have fur-

nished seven useful starting points for consideration in *Exhibit III*.

A successful application. An example from a highly successful job enrichment experiment can illustrate the distinction between horizontal and vertical loading of a job. The subjects of this study were the stockholder correspondents employed by a very large corporation. Seemingly, the task required of these carefully selected and highly trained correspondents was quite complex and challenging. But almost all indexes of performance and job attitudes were low, and exit interviewing confirmed that the challenge of the job existed merely as words.

A job enrichment project was initiated in the form of an experiment with one group, designated as an achieving unit, having its job enriched by the principles described in *Exhibit III*. A control group continued to do its job in the traditional way. (There were also two "uncommitted" groups of correspondents formed to measure the so-called Hawthorne Effect – that is, to gauge whether productivity and attitudes toward the job changed artificially merely because employees sensed that the company was paying more attention to them in doing something different or novel. The results for these groups were substantially the same as for the control group, and for the sake of simplicity I do not deal with them in this summary.) No changes in hygiene were introduced for either group other than those that would have been made anyway, such as normal pay increases.

The changes for the achieving unit were introduced in the first two months, averaging one per week of the seven motivators listed in *Exhibit III*. At the end of six months the members of the achieving unit were found to be outperforming their counterparts in the control group, and in addition indicated a marked increase in their liking for their jobs. Other results showed that the achieving group had lower absenteeism and, subsequently, a much higher rate of promotion.

Exhibit IV illustrates the changes in performance, measured in February and March, before the study period began, and at the end of each month of the study period. The shareholder service index represents quality of letters, including accuracy of information, and speed of response to stockholders' letters of inquiry. The index of a current month was averaged into the average of the two prior months, which means that improvement was harder to obtain if the indexes of the previous months were low. The "achievers" were performing less well before the six-month period started, and their performance service index continued to decline after the introduction of the motivators, evidently because of un-

certainty after their newly granted responsibilities. In the third month, however, performance improved, and soon the members of this group had reached a high level of accomplishment.

Exhibit V shows the two groups' attitudes toward their job, measured at the end of March, just before the first motivator was introduced, and again at the end of September. The correspondents were asked 16 questions, all involving motivation. A typical one was, "As you see it, how many opportunities do you feel that you have in your job for making worthwhile contributions?" The answers were scaled from 1 to 5, with 80 as the maximum possible score. The achievers became much more positive about their job, while the attitude of the control unit remained about the same (the drop is not statistically significant).

How was the job of these correspondents restructured? *Exhibit VI* lists the suggestions made that were deemed to be horizontal loading, and the actual vertical loading changes that were incorporated in the job of the achieving unit. The capital letters under "Principle" after "Vertical loading" refer to

the corresponding letters in *Exhibit III*. The reader will note that the rejected forms of horizontal loading correspond closely to the list of common manifestations I mentioned earlier.

Steps for Job Enrichment

Now that the motivator idea has been described in practice, here are the steps that managers should take in instituting the principle with their employees:

1. Select those jobs in which (a) the investment in industrial engineering does not make changes too costly, (b) attitudes are poor, (c) hygiene is becoming very costly, and (d) motivation will make a difference in performance.

2. Approach these jobs with the conviction that they can be changed. Years of tradition have led managers to believe that the content of the jobs is sacrosanct and the only scope of action that they have is in ways of stimulating people.

3. Brainstorm a list of changes that may enrich the jobs, without concern for their practicality.

4. Screen the list to eliminate suggestions that involve hygiene, rather than actual motivation.

5. Screen the list for generalities, such as "give them more responsibility," that are rarely followed in practice. This might seem obvious, but the moti-

vator words have never left industry; the substance has just been rationalized and organized out. Words like "responsibility," "growth," "achievement," and "challenge," for example, have been elevated to the lyrics of the patriotic anthem for all organizations. It is the old problem typified by the pledge of allegiance to the flag being more important than contributions to the country – of following the form, rather than the substance.

6. Screen the list to eliminate any *horizontal* loading suggestions.

7. Avoid direct participation by the employees whose jobs are to be enriched. Ideas they have expressed previously certainly constitute a valuable source for recommended changes, but their direct involvement contaminates the process with human relations *hygiene* and, more specifically, gives them only a *sense* of making a contribution. The job is to be changed, and it is the content that will produce the motivation, not attitudes about being involved or the challenge inherent in setting up a job. That process will be over shortly, and it is what the employees will be doing from then on that will determine their motivation. A sense of participation will result only in short-term movement.

8. In the initial attempts at job enrichment, set up a controlled experiment. At least two equivalent groups should be chosen, one an experimental unit in which the motivators are systematically introduced over a period of time, and the other one a control group in which no changes are made. For both groups, hygiene should be allowed to follow its natural course for the duration of the experiment. Pre- and post-installation tests of performance and job attitudes are necessary to evaluate the effectiveness of the job enrichment program. The attitude test must be limited to motivator items in order to divorce employees' views of the jobs they are given from all the surrounding hygiene feelings that they might have.

9. Be prepared for a drop in performance in the experimental group the first few weeks. The change-over to a new job may lead to a temporary reduction in efficiency.

10. Expect your first-line supervisors to experience some anxiety and hostility over the changes you are making. The anxiety comes from their fear that the changes will result in poorer performance for their unit. Hostility will arise when the employees start assuming what the supervisors regard as their own responsibility for performance. The supervisor without checking duties to perform may then be left with little to do.

After successful experiment, however, the supervisors usually discover the supervisory and man-

Exhibit VI Enlargement vs. enrichment of correspondents' tasks in company experiment		
Horizontal loading suggestions rejected	Vertical loading suggestions adopted	Principle
Firm quotas could be set for letters to be answered each day, using a rate which would be hard to reach.	Subject matter experts were appointed within each unit for other members of the unit to consult with before seeking supervisory help. (The supervisor had been answering all specialized and difficult questions.)	G
The secretaries could type the letters themselves, as well as compose them, or take on any other clerical functions.	Correspondents signed their own names on letters. (The supervisor had been signing all letters.)	B
All difficult or complex inquiries could be channeled to a few secretaries so that the remainder could achieve high rates of output. These jobs could be exchanged from time to time.	The work of the more experienced correspondents was proofread less frequently by supervisors and was done at correspondents' desks, dropping verification from 100% to 10%. (Previously, all correspondents' letters had been checked by the supervisor.)	A
The secretaries could be rotated through units handling different customers, and then sent back to their own units.	Production was discussed, but only in terms such as "a full day's work is expected." As time went on, this was no longer mentioned. (Before, the group had been constantly reminded of the number of letters that needed to be answered.)	D
	Outgoing mail went directly to the mailroom without going over supervisors' desks. (The letters had always been routed through the supervisors.)	A
	Correspondents were encouraged to answer letters in a more personalized way. (Reliance on the form-letter approach had been standard practice.)	C
	Each correspondent was held personally responsible for the quality and accuracy of letters. (This responsibility had been the province of the supervisor and the verifier.)	B, E

agerial functions they have neglected, or which were never theirs because all their time was given over to checking the work of their subordinates. For example, in the R&D division of one large chemical company I know of, the supervisors of the laboratory assistants were theoretically responsible for their training and evaluation. These functions, however, had come to be performed in a routine, unsubstantial fashion. After the job enrichment program, during which the supervisors were not merely passive observers of the assistants' performance, the supervisors actually were devoting their time to reviewing performance and administering thorough training.

What has been called an employee-centered style of supervision will come about not through education of supervisors, but by changing the jobs that they do.

Concluding Note

Job enrichment will not be a one-time proposition, but a continuous management function. The initial changes should last for a very long period of time. There are a number of reasons for this:

- The changes should bring the job up to the level of challenge commensurate with the skill that was hired.

- Those who have still more ability eventually will be able to demonstrate it better and win promotion to higher level jobs.

- The very nature of motivators, as opposed to hygiene factors, is that they have a much longer term effect on employees' attitudes. Perhaps the job will have to be enriched again, but this will not occur as frequently as the need for hygiene.

Not all jobs can be enriched, nor do all jobs need to be enriched. If only a small percentage of the time and money that is now devoted to hygiene, however, were given to job enrichment efforts, the return in human satisfaction and economic gain would be one of the largest dividends that industry and society have ever reaped through their efforts at better personnel management.

The argument for job enrichment can be summed up quite simply: if you have employees on a job, use them. If you can't use them on the job, get rid of them, either via automation or by selecting someone with lesser ability. If you can't use them and you can't get rid of them, you will have a motivation problem.

Retrospective Commentary

I wrote this article at the height of the attention on improving employee performance through various (contrived) psychological approaches to human relations. I tried to redress industrial social scientists' overconcern about how to treat workers to the neglect of how to design the work itself.

The first part of the article distinguishes between motivation and movement, a distinction that most writing on motivation misses. Movement is a function of fear of punishment or failure to get extrinsic rewards. It is the typical procedure used in animal training and its counterpart, behavioral modification techniques for humans. Motivation is a function of growth from

getting intrinsic rewards out of interesting and challenging work.

While the immediate behavioral results from movement and motivation appear alike, their dynamics, which produce vastly different long-term consequences, are different. Movement requires constant reinforcement and stresses short-term results. To get a reaction, management must constantly enhance the extrinsic rewards for movement. If I get a bonus of \$1,000 one year and \$500 the next, I am getting extra rewards both years, but psychologically I have taken a \$500 salary cut.

Motivation is based on growth needs. It is an internal engine, and its benefits show up over a long period of time. Because the ultimate re-

ward in motivation is personal growth, people don't need to be rewarded incrementally. I write a book – a big accomplishment. Then I write an article – a lesser accomplishment, but nevertheless an addition to my personal growth.

For this article, I invented the acronym KITA (kick in the ass) to describe the movement technique. The inelegance of the term offended those who consider good treatment a motivating strategy, regardless of the nature of the work itself. In this plain language I tried to spotlight the animal approach to dealing with human beings that characterizes so much of our behavioral science intervention.

The article's popularity stems in great part from readers' recognition

Figure A **How the hygiene-motivator factors affect job attitudes in six countries**

that KITA underlies the assumed benevolence of personnel practices. If I were writing "One More Time" in 1987, I would emphasize the important, positive role of organizational behaviorists more than I did in 1968. We can certainly learn to get along better on the job. Reduced workplace tension through congenial relations is a necessary ingredient of a pleasant environment.

The second part of the article describes my motivation-hygiene theory. It suggests that environmental factors (hygienes) can at best create no dissatisfaction on the job, and their absence creates dissatisfaction. In contrast, what makes people happy on the job and motivates them are the job content factors (motivators). The controversy surrounding these concepts continues to this day.

While the original 12 studies were mostly American (they also included Finnish supervisors and Hungarian engineers), the results have been

Retrospective Commentary (continued)

replicated throughout the world. A sampling of recent foreign investigations, which the reader can compare with the first American studies detailed in *Exhibit I* in “One More Time,” appears in *Figure A*. The similarity of the profiles is worth noting.

The 1970s was the decade of job enrichment (discussed in the third part of the article), sometimes called job design or redesign by opponents of the motivation-hygiene theory. Since the first trial-and-error studies at AT&T, experience has produced refinements of the procedures for job enrichment and the goals for achieving it. I like to illustrate them in the wheel shown in *Figure B*.

This diagram reflects my conviction that the present-day abstraction of work has shut out feelings from the job content. Finance, for example, has become the focus of attention in most businesses, and nothing is more abstract and devoid of feeling. Part of the blame can be laid to electronic communication, which promotes detachment and abstraction. Job enrichment grows out of knowing your product and your client with feeling, not just intellectually.

With reference to the motivator ingredients discussed in the 1968 article, “recognition for achievement” translates into “direct feedback” in *Figure B*. The wheel in *Figure B* shows this feedback to come chiefly from the client and product of the work itself, not from the supervisor (except in the case of new

hires). The motivator factor “responsibility” translates into a number of ingredients: self-scheduling, authority to communicate, control of resources, and accountability. Finally, the motivator factors “advancement” and “growth” translate into the central dynamic of new learning leading to unique expertise. The feeling of satisfaction is also indicated as a dynamic of learning from clients and products.

The key to job enrichment is nurture of a client relationship rather than a functional or hierarchical relationship. Let me illustrate with a diagram of relationships in an airplane overhaul project carried out for the U.S. Air Force (*Figure C*). The avionics mechanic’s external client is the test pilot, and although he reports to his supervisor, his supervisor serves him. The sheet metal mechanic and the line mechanic serve the avionics mechanic. And so on back into the system.

By backing into the system, you can identify who serves whom – not who reports to whom – which is critical in trying to enrich jobs. You identify the external client, then the core jobs, or internal client jobs, serving that client. You first enrich the core jobs with the ingredients shown in *Figure B* and then enrich the core jobs that serve these internal clients.

During the 1970s, critics predicted that job enrichment would reduce the number of employees. Ironically, the restructuring and downsizing of

U.S. companies during the 1980s have often serendipitously produced job enrichment. With fewer employees performing the same tasks, some job enrichment was inevitable. But the greater efficiency of enriched jobs ultimately leads to a competitive edge and more jobs.

Today, we seem to be losing ground to KITA. It’s all the bottom line, as the expression goes. The work ethic and quality of worklife movement have succumbed to the pragmatics of worldwide competition and the escalation of management direction by the abstract fields of finance and marketing – as opposed to production and sales, where palpable knowledge of clients and products resides. These abstract fields are more conducive to movement than to motivation. I find the new entrants in the world of work on the whole a passionless lot intent on serving financial indexes rather than clients and products. Motivation encompasses passion; movement is sterile.

To return to “One More Time”: I don’t think I would write it much differently today, though I would include the knowledge gained from recent job enrichment experiments. The distinction between movement and motivation is still true, and motivation-hygiene theory is still a framework with which to evaluate actions. Job enrichment remains the key to designing work that motivates employees.

ARTICLES

[“Six Dangerous Myths About Pay”](#) by Jeffrey Pfeffer (*Harvard Business Review*, May–June 1998, Product no. 98309)

Pfeffer restricts his considerations in this article to pay alone, whereas Herzberg discusses pay as one of many hygiene factors that fail to motivate. Like Herzberg, however, Pfeffer marshals evidence to show that pay, the manager’s most favored motivational mechanism, “in reality, undermines performance.” He lists and discusses six myths about pay. Among them: individual incentive pay improves performance, and people work primarily for money. These myths are “dangerous,” says Pfeffer, because “they absorb vast amounts of management time and make everybody unhappy.”

[“Rethinking Rewards”](#) by Alfie Kohn (*Harvard Business Review*, November–December 1993, Product no. 93610)

In this follow-up to Kohn’s earlier HBR article, “Why Incentive Plans Cannot Work,” nine experts from business, academia, and research blast away at Kohn’s contention that “incentive plans *must* fail, because they are based on a patently inadequate theory of motivation.” Kohn responds with a commentary that is clearly aligned with Herzberg’s assertions in “One More Time,” rejecting contentions that extrinsic factors do anything but harm motivation and advocating intrinsic motivators to spur innovation and excellence.

[“The Power of Predictability”](#) by Howard H. Stevenson and Mihnea C. Moldoveanu (*Harvard Business Review*, July–August 1995, Product no. 95409)

This article reaches back to the dawn of humankind to assert that people form and join organizations—including companies—to fulfill the “human need” for predictability. Today predictability is being shattered, the authors claim, by an “intensely competitive, rapidly changing global economy.” What’s the best way for managers to respond, and thereby encourage employees to focus on creating value? They can restore predictability by making few promises and then keeping those they do make. And they should realize that people prefer dire predictions to no predictions at all, or to positive predictions that no one believes.
